

Dear customer,

Thank you for choosing to purchase our aluminum profiles. Our profiles are manufactured according to DIN EN 12020-1 from the alloys EN AW-6060 and EN AW-6063 and correspond to the anodizing quality according to DIN 17611. Our quality assurance department constantly checks these to ensure the quality of our products.

However, there may be minor but permissible irregularities of the surface such as streaks, chafing, indentations or slate stela. These are production-related optical deviations that cannot be prevented permanently, but do not cause any functional defects.

Discoloration as well as a somewhat uneven appearance resulting from forming in the extrusion process and subsequent heat treatment are generally unavoidable on the product surface. A simple test procedure is to view the surface in daylight from a distance of 2 meters indoors. No serious surface defects should be visible here.
